
AriaMindX

SEO Setup — Session Summary

Domain: `https://ariamindx.com`

Platform: `Next.js 15 · Hostinger VPS (Ubuntu 24.04) · PM2 · Nginx`

Date: `27 June 2026`

Goal: `Be findable via brand-name variations through SEO`

1. Goal & Outcome

The app is hosted at ariamindx.com but was previously titled only "Aria Mind". The objective was to make the site discoverable through search-engine optimization for every spelling people might type: "aria mind x", "ariamindx", "ariamind x", "aria min x", etc.

Outcome

- Full SEO foundation added: rich metadata, JSON-LD structured data, robots.txt, sitemap.xml, web manifest, and a www -> non-www redirect.
- Site now RANKS for "aria mind x" (confirmed live in Google).
- Brand name standardised to "AriaMindX" across all visible UI and metadata.
- Canonical domain fixed to the non-www version: <https://ariamindx.com>

2. Files Created / Modified

Created

app/robots.ts	Generates /robots.txt — allows public pages, blocks private app areas, points to sitemap.
app/sitemap.ts	Generates /sitemap.xml listing public/indexable routes.
app/manifest.ts	PWA web manifest with brand name + icons.

Modified

app/layout.tsx	Core SEO: title template, description, keywords, OpenGraph, Twitter cards, canonical, robots, plus two JSON-LD blocks (Organization + WebSite) with alternateName aliases, description and sameAs scaffold.
next.config.ts	Added 301 redirect www.ariamindx.com -> ariamindx.com .
lib/businessInfo.ts	Brand casing fixed; website set to non-www.
components/AionLogo.tsx	Logo alt text -> "AriaMindX".
components/LandingPage.tsx	All visible "AriamindX" wordmarks/text -> "AriaMindX".
components/AuthForm.tsx	Brand wordmark casing fixed.
components/BillingPageContent.tsx	Razorpay checkout name -> "AriaMindX".
lib/invoice.ts	Invoice brand name -> "AriaMindX".
types/aion.ts	Fixed swapped mode taglines (Aria Research / Aria Diverse).

3. Brand-Name Index (Aliases)

Defined once as BRAND_ALIASES in app/layout.tsx. This single array feeds the meta keywords AND the JSON-LD alternateName for both Organization and WebSite. To change searchable names later, edit only this array, then rebuild + redeploy.

```
const BRAND_ALIASES = [  
  "AriaMindX", "Aria Mind X", "AriaMind X",  
  "Aria MindX", "Aria Min X", "Aria Mind",  
  "ariamindx", "ariamindx.com",  
  "JB AI", "JBAI", "Anoop AI",  
  "AnoopAI", "Anup AI", "AnupAI"  
];
```

Note: generic names like "anoop ai" / "jb ai" are unlikely to rank — they belong to established, unrelated entities.

The winnable, unique query is "ariamindx". See Key Learnings.

4. SEO Procedure (Step by Step)

- Add metadata + JSON-LD in app/layout.tsx (alternateName is the key signal that ties all spellings to one brand).
- Add robots.ts, sitemap.ts, manifest.ts.
- Pick a canonical host (non-www) and 301-redirect the other.
- Make the visible brand wordmark + page text match the brand exactly.
- Deploy (build + PM2 restart).
- Verify domain in Google Search Console (DNS TXT).
- Submit sitemap.xml; request indexing of homepage + key pages.
- Validate structured data at validator.schema.org.
- Repeat in Bing Webmaster Tools (import from Google).
- Build off-site entity signals (social profiles, Product Hunt, backlinks) and wait 2-8 weeks.

5. DNS Configuration (Hostinger)

Set in hPanel -> Domains -> ariamindx.com -> DNS / Nameservers. VPS IP: 82.29.167.41

A @	82.29.167.41 (root domain -> VPS)
CNAME www	ariamindx.com (www -> root -> VPS)
TXT @	google-site-verification=ddnc1XUa5LobeT5inB6i0h6UD5evAKIsIQKFT6

TTL = Time To Live (seconds a record is cached). Use 300 while changing DNS; 3600+ once stable. Never delete the google-site-verification TXT record or you lose Search Console verification.

6. Nginx + HTTPS Configuration

/etc/nginx/sites-available/ariamindx.com — three server blocks: http->https, www->non-www, and the app proxy.

```
# http (www + non-www) -> https non-www
server {
    listen 80; server_name ariamindx.com www.ariamindx.com;
    return 301 https://ariamindx.com$request_uri;
}
# https www -> https non-www
server {
    listen 443 ssl; server_name www.ariamindx.com;
    return 301 https://ariamindx.com$request_uri;
}
# app proxy
server {
    listen 443 ssl; server_name ariamindx.com;
    location / {
        proxy_pass http://127.0.0.1:3000;
        proxy_set_header Host $host;
        proxy_set_header X-Forwarded-Proto $scheme;
    }
}
```

```
sudo certbot --nginx -d ariamindx.com -d www.ariamindx.com
sudo nginx -t && sudo systemctl reload nginx
```

7. Deploy Procedure & Flow Diagram

CORRECT deploy loop on the VPS (never run "npm run dev" on production):

```
cd /var/www/aion-mind
git pull origin master
npm install
rm -rf .next      # clean, avoids ChunkLoadError
npm run build
pm2 restart aion-mind --update-env
pm2 save
```

Request flow

```
User browser
| https://(www.)ariamindx.com
v
[ Nginx :443 ] --www--> 301 -> non-www
| proxy_pass
v
[ Next.js (PM2) :3000 ]
|
v
Rendered page (+ robots.txt / sitemap.xml / JSON-LD)
```

Indexing flow

```
Deploy -> Googlebot crawls site
-> reads <title>, meta, JSON-LD alternateName
-> follows sitemap.xml
-> indexes pages
-> (weeks) builds brand ENTITY from sameAs + backlinks
-> ranks for 'ariamindx' + variations
```

8. Google Search Console Steps

- Add Domain property for ariamindx.com -> verify via DNS TXT (DONE: Ownership verified).
- Sitemaps -> submit: sitemap.xml
- URL Inspection -> https://ariamindx.com -> Request Indexing (repeat for /about, /pricing, /contact).
- Keep the TXT record forever to stay verified.
- Monitor: Pages (indexed count) and Performance (queries).

Schema validator	https://validator.schema.org
Rich Results test	https://search.google.com/test/rich-results

10. Key Learnings & Caveats

- alternateName ties spelling variants to one brand — the single most useful tag for name-variation search.
- Do NOT keyword-stuff alternateName (e.g. 'aria mind x chatgpt/openai/llm'). It risks spam flags and dilutes the brand; keep ~6-10 real name spellings only.
- Google chooses the displayed title itself; on-page brand consistency is the strongest nudge. Title updates lag days-to-weeks after re-crawl.

- AI Overview confusion (K-pop 'Aria') is an ENTITY problem, not a metadata one. Fixed only by off-site signals: sameAs profiles, Product Hunt, backlinks + time.
- Generic personal names ('anoop ai', 'jb ai') belong to established entities and will not rank for a new site. Focus on the unique 'ariamindx'.
- Always pick ONE canonical host (non-www here) and 301 the other, or Google splits ranking signal.
- **Never run 'npm run dev' on production — it corrupts the .next build PM2 serves and causes ChunkLoadError.**

11. Troubleshooting Log

ChunkLoadError / 'client-side exception' on chat page

Cause: running 'npm run dev' over the PM2 'next start' process regenerated .next with new chunk hashes; the served HTML referenced old (now missing) chunks -> 400 Bad Request.

Fix:

```
pkill -f "next dev"          # kill stray dev server
pm2 stop aion-mind
rm -rf .next
npm run build
pm2 restart aion-mind --update-env
# then hard-refresh browser (Ctrl+Shift+R)
```
